## 2019 WHEAT CROP REVIEW

### Weather and Crop Development

The 2019 winter wheat growing season in Kansas was a tale of two crops: one extremely challenged (though resilient) crop in the central and eastern portions of the state, and a crop that was exposed to near-optimal conditions in western Kansas.

#### *Central and Eastern Kansas*

The challenges faced by the wheat crop started early for central and eastern Kansas, with an excessive amount of rainfall during sowing time. Parts of south central Kansas received as much as 19 inches of precipitation between September 1 and November 30, which delayed wheat sowing and, in many cases, precluded producers from sowing wheat. This situation was worsened where producers had to harvest a summer crop (soybeans) prior to sowing wheat. Consequently, the state of Kansas set two new records: (1) the latest sowing of the second half of the crop (approximately 55% of Kansas wheat fields were sown prior to October 5, and in many cases the remaining crop was not sown until mid-November); and (2) the lowest area planted to winter wheat in Kansas in approximately 100 years. The fall of 2018 had an early onset of cold temperatures, which was not conducive for wheat emergence and tillering. While early-sown fields showed good fall development, many fields sown into November showed very limited fall development and did not start tillering until late February and early March. With a majority of fields sown late, and coupled with a cool fall, there were very limited reports of aphids and the virus diseases they might transmit, such as barley yellow dwarf.

The remaining of the growing season was also cooler and moister than average in central and eastern Kansas. From approximately April 1 until June 10, total precipitation ranged from 10.5 to 30.2 inches in the central corridor, which is excessive. Water-logging was a common theme during between boot and flowering stages of development. The amount of waterlogging in a given field depended on field slope and drainage capacity, but the majority of the fields in Sumner and Cowley counties had large drowned-out portions. The excessive moisture during the growing season might also have increased nitrogen and sulfur losses via leaching and denitrification (in the case of nitrogen), rendering many fields in central Kansas nitrogen deficient. Typical symptoms included shortened pale green canopy with limited head size accompanied by contrasting cow pocks of higher fertility. During May, a few hail events brought localized damage and crop termination to some fields in south central Kansas.

Due to the above-average moisture regime, the incidence of fungal diseases such as stripe rust, leaf rust, and especially Fusarium head blight were also above normal, leading to yield losses across the central portion of the state. Hutchinson, for example, was a hotspot for both leaf and stripe rust, while head scab was scattered across the entire central portion of the state. For more details on disease incidence, refer to the disease section in this report.

The combination of delayed sowing, excessive precipitation (more than 60 inches during the growing season for portions of south central Kansas), and below-average temperatures led to a delayed harvest of about 14 days as compared to the long-term average. Likewise, excessive rainfall led to high field-to-field variability in the central portion of the state. It was not uncommon to hear reports of yields of about 60 bushels per acre and test weights of 62 pounds per bushel from one field (typically better-drained, sandier soils), while a neighboring field from the same producer yielded 20 bushels per acre with 55 pounds per bushel test weight (flat fields with worse drainage capacity).

#### *Western Kansas*

The western Kansas crop had, overall, a very favorable growing season. Sufficient rainfall during sowing time (ranging from 0.5 to approximately 2 inches between October and November) ensured a good stand establishment. For the most part, the western Kansas wheat crop was sown in a timely manner with the exception of some fields sown after corn, which were delayed due to rainfall during October. However, this represented a minority of the fields, especially when compared to the proportion of fields sown late in central Kansas. An early onset of cold temperatures in the fall avoided excessive fall growth and decreased the incidence of viral diseases that are transmitted by aphids or by the wheat curl mite, restricting wheat streak mosaic occurrence to isolated cases.

Winter precipitation in the form of snowfall was above average, as was spring rainfall in western Kansas, resulting in a full moisture soil profile. This portion of the state received anywhere from 4–13 inches of precipitation between April 1 and June 10, which ensured great grain filling conditions. These above-average precipitation amounts also led to some visible symptoms of nitrogen deficiency in many fields in western Kansas, likely due to a mismatch between nitrogen positioning in the soil profile (leached down below the root zone due to above-average precipitation), coupled to a decreased root system due to

cooler temperatures. Many symptoms of nitrogen deficiency faded after slightly greater temperatures in May allowed for better root development. Despite above-average precipitation, the occurrence of stripe and leaf rusts was sporadic and, while observed at levels to ensure fungicide application in susceptible varieties, caused considerably less yield losses as compared to those observed in central Kansas. During June, a few hail events brought localized damage and crop termination to some fields in western Kansas. It is imperative that producers control their volunteer wheat in fields affected by hail, as the occurrence of volunteer wheat will be greater under these conditions.

Temperatures during the entire growing season were below-average, which delayed crop development. Although a late-developing crop is typically more exposed to heat stress, temperatures during the grain fill period continued to be below-average [April temperature: 57°F (+1.2°F), May temperature: 60°F (-3.3 °F), and June temperature: 72°F (-0.9°F)], which led to longer grain filling period and increased overall yield. Many growers reported yields of 60–70 bushels per acre as opposed to their long-term average of 30–35 bushels per acre and, in many cases, yields greater than 100 bushels per acre were reported. This increased grain filling period, in combination with continuous rainfall events, delayed harvest in parts of the state, leading to one of the latest harvests in recent years. (Romulo Lollato, Kansas State University Extension Wheat Specialist and Mary Knapp, Kansas State University Climatologist)

### Diseases

Diseases were a major factor for wheat production in 2019. The frequent rainfall and extended periods of high relative humidity favored the development of many fungal diseases. Both stripe rust and leaf rust were severe in many of the variety testing locations. Evidence suggests that the rust populations changed to overcome the genetic resistance of several widely-grown varieties.

Leaf spot diseases and Fusarium head blight (head scab) were also problematic in the central and eastern regions of the state. Delays in planting and cold fall temperatures slowed the development of viral diseases including barley yellow dwarf and wheat streak mosaic. As a result, the yield losses to these diseases were below-normal in most areas. The incidence of wheat soilborne mosaic was abnormally high in parts of central and western Kansas. (Erick De Wolf, Kansas State University Department of Plant Pathology)

### Insects

Overall, wheat pest problems were relatively infrequent in the fall of 2018 and into the spring of 2019. Some early-planted fields still had serious problems with Hessian flies, to the extent that some spots were replanted.

There were also armyworm problems, both in the fall and then again in the spring. Many fields required treatment in the fall to prevent foliage loss. Spring armyworm infestations were widespread and usually started in areas of brome before moving into adjacent wheat fields. On average, one armyworm can consume about 3 whole wheat plants during the course of the worm's development.

Grasshoppers also caused a little concern in the spring, but that is not unusual. (Holly Davis and Jeff Whitworth, Kansas State University Department of Entomology)

### Harvest Statistics

The Kansas Agricultural Statistics' July estimate of the 2019 crop was 330 million bushels from 6.6 million acres, down 10% from last year's crop. Yield per harvested acre is expected to average 50 bushels, up 12 bushels from last year's final yield. (July 2019, *Crops Report*, Kansas Agricultural Statistics)

Figure 1. Historical Kansas wheat production

SY Monument moved into the top spot as the new leading variety for Kansas, accounting for 7.2% of the state's planted acres. WB Grainfield rose from the fourth most popular variety to the second spot in 2019 at 6.4%. Winterhawk came in at the third spot with 4.8%. Zenda moved into the top five from the eighteenth spot last year at 4.7%. Everest dropped to the fifth spot with 3.8%. (March 2019, *Wheat Variety*, Kansas Agricultural Statistics)

## 2019 PERFORMANCE TESTS

The Kansas Agricultural Experiment Station annually compares both new and currently grown varieties in the state's major crop-producing areas. These performance tests generate unbiased performance information designed to help Kansas growers select wheat varieties suited for their area and conditions.

Site descriptions and management practices for each site are summarized in Table 3. One-year or one-location results can be misleading because of the possibility of unusual weather or pest conditions. **Be sure to keep extenuating environmental conditions in mind when examining test results.** For more information please visit: [agronomy.ksu.edu/services/crop-performance-tests/index/html](http://agronomy.ksu.edu/services/crop-performance-tests/index/html).

### Varieties

Public varieties are selected for inclusion in the tests on the basis of several criteria. Most represent new or established varieties from Nebraska, Oklahoma, Texas, and Colorado with potential for successful use in Kansas. Some are included as long-term checks. Others are entered at the request of the originating institution.

Originators or marketers enter privately developed varieties voluntarily. Entrants choose both the entries and test sites. The 2019 entrants are listed in Table 1.

### Results and Variety Characterization

Results from Kansas tests are presented in Tables 4 through 9. Yields are reported as bushels per acre (60 lb/bu) and are adjusted to a moisture content of 13% where moistures were reported at harvest. Yields also are converted to percentages of the test average to speed recognition of the highest-yielding entries. Multi-year averages are presented for those varieties entered more than 1 year.

Additional information such as test weight, heading date, and plant height is helpful for fine-tuning variety

comparisons. Planting varieties with a range of maturities helps minimize weather risks.

At the bottom of each table is the (0.05) least significant difference (LSD) for each column of replicated data. The LSD is essentially a "margin of error" that shows how big the difference between two varieties must be for one to be 95% confident that the difference is real. The use of the LSD is intended to reduce the chance of overemphasizing small differences. Small variations in soil structure, fertility, water-holding characteristics, and other test-site characteristics can cause considerable yield variation among plots of one variety.

### Electronic Access

To access crop performance testing information electronically, visit the website at: [agronomy.ksu.edu/services/crop-performance-tests/index/html](http://agronomy.ksu.edu/services/crop-performance-tests/index/html).

### Research and Duplication Policy

When companies submit entries, permission is given to Kansas State University to test varieties and/or hybrids designated on the entry forms in the manner indicated in the test announcements. Seed submitted for testing should be a true sample of the seed being offered for sale.

All results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety, provided the source is referenced and data are not manipulated or reinterpreted; and 2) advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1151 '2019 Kansas Performance Tests with Winter Wheat Varieties,' or the Kansas Crop Performance Test website, [agronomy.ksu.edu/services/crop-performance-tests](http://agronomy.ksu.edu/services/crop-performance-tests) for details. Endorsement or recommendation by Kansas State University is not implied."

<b><u>South Central Dryland</u></b>						
South Central KS Farmer's Field McPherson (MC)	Crete silt loam Wheat	60	0	0	10/3/2018- 60 lb/a	Abandoned. Poor emergence after 7 inches of rain in October.
South Central KS Experiment Field Hutchinson (HU)	Funmar-Taver loam Soybean	90	0	0	10/22/2018-6/25/2019 75 lb/a	Stripe rust and leaf rust were present. No fungicide applied.
South Central KS Farmer's Field Conway Springs (CW)	Sandy loam Fallow	40	0	0	11/6/2018- 60 lb/a	Abandoned. Water-logged soils for portion of growing season.
<b><u>Northwest Dryland</u></b>						
Agricultural Research Center Hays (HA)	Harney silt loam Wheat	70	0	0	10/3/2018-7/2/2019 60 lb/a	No fungicide applied. Stripe rust was present in susceptible varieties. Uneven emergence in the fall.
Northwest Research-Extension Center Colby (CO)	Keith silt loam Wheat	60	0	0	9/24/2018-7/14/2019 60 lb/a	Fungicide applied. Good establishment in the fall.
Northwest Research-Extension Center Tribune (TR)	Richfield silt loam Wheat	100	24	0	10/5/2018-7/11/2019 60 lb/a	Fungicide applied. Some stripe and leaf rust present.
Northwest KS Farmer's Field Decatur (DC)	Harney clay loam Field pea	40	0	0	9/27/2018-7/19/2019 90 lb/a	Fungicide applied. Good establishment in the fall.
<b><u>Southwest Dryland</u></b>						
Southwest KS Farmer's Field Larned (LA)	Harney clay loam Grain sorghum	80	40	0	10/2/2018- 90 lb/a	Abandoned. Poor emergence in the fall.
Southwest KS Farmer's Field Mullinville (MV)	Harney clay loam Grain sorghum	100	0	0	10/2/2018- 90 lb/a	Abandoned. Poor emergence in the fall.
Southwest Research-Extension Center Garden City (GC)	Keith silt loam Grain sorghum	60	0	0	9/25/2018-7/6/2019 65 lb/a	No fungicide applied. Above-normal precipitation led to a good growing season.
<b><u>Western Irrigated</u></b>						
Northwest Research-Extension Center Colby (CO)	Keith silt loam Fallow	100	0	0	9/24/2018-7/14/2019 120 lb/a	Fungicide applied. Some stripe rust was present.
Southwest Research-Extension Center Garden City (GC)	Keith silt loam Grain sorghum	100	0	0	9/25/2018-7/6/2019 120 lb/a	Fungicide applied. Above-normal precipitation led to a good growing season.
Western KS Farmer's Field Healy, Lane County (LN)	Scott silt loam Fallow	90	0	0	9/22/2018-7/11/2019 80 lb/a	Fungicide applied. Generally good growing conditions with mild hail late in season.
