KANSAS CERTIFIED SEED DIRECTORY of producers of field crops including wheat, spring oats, triticale, rye, canola, and winter barley

THE BEST KEEPS GETTING BETTER

THE GREAT PLAINS BD7600

How do you make the best even better? Start with revolutionary design features, like a split-box configuration, higher capacity, and innovative feeder cups that meter by shaft speed for greater accuracy. Then, add practical technology like DrillCommand® and hydraulic drive to execute variable-rate and prescription mapped seeding effortlessly from the tractor cab. As a result, you end up with the most productive, versatile, and operator-friendly box drill ever produced – the Great Plains **BD7600**.

Great Plains
"Harvest Starts Here."

Visit **GreatPlainsAg.com** for more information
and check out our **BOLD** new financing programs!

New Features. New Options. Endless Possibilities.
Ensure that your farm has the best – ask your Great Plains dealer about the BD7600 today!

2021 WHEAT CROP REVIEW

Weather and Crop Development

Fall growing conditions: A tale of two crops

The month of September 2020 had good moisture conditions across the state of Kansas, with rainfall totals ranging between 0.75 and 6 inches. This moisture ensured that fields planted between early September until the very early part of October had good emergence and a decent stand establishment in the fall. However, the month of October was dry for the majority of the state, with precipitation totals ranging from 0 to 0.5 inches – with the exception of the southernmost tier of Kansas counties that received up to 5.6 inches of rainfall. In many cases, these dry October conditions had two main consequences: first, they did not allow fields planted mid- to late-October to emerge until the next precipitation event, which did not happen until November or, in some cases, December. Second, the dry October reduced the amount of forage biomass produced by early planted wheat crops. The month of November brought anywhere from 0.5 to 7.6 inches of precipitation to the different Kansas wheat growing regions. The far southwest portion of the state missed some of these rains, and severe drought started to develop.

The weather conditions described above resulted in two very distinct wheat crops going into the winter: one emerged in September or early October, and another emerged after November, and many times as late as December.

Arctic temperatures during the winter and the potential for winterkill

The winter started on the warm side with December and January averaging 3.5 degrees warmer than normal. However, the month of February was much cooler than normal, averaging 11.0 degrees below normal. Much of this occurred during a two-day period where air temperatures reached close to negative 30°F, with as many as 230 hours of air temperatures below the 12°F threshold that can induce winterkill in winter wheat. The potential for winterkill was worsened by a very limited snow cover accompanying these cold temperatures. The majority of the state received between one and two inches of snow, with portions of central Kansas receiving no snow whatsoever. This compared to neighboring states receiving as much as 10-20 inches. However, the soil temperatures during this period of extremely cold temperatures provided a positive outlook, as soils never reached below 12-14°F. In years with widespread winterkill, soil temperatures often reach single digits. Soil temperatures are important because during the winter, the growing point of the wheat plant is still below ground and protected by the soil. There were a few fields in the central portion of the state (Ottawa County and surrounding region) that showed severe tiller dieback due to these artic temperatures, but overall the mild soil temperatures helped the crop buffer any potential injury.

The prolonged winter maintained the wheat crop dormant for a relatively long time. Most of the varieties evaluated in Hutchinson by K-State Research and Extension did not reach the first hollow stem stage of development until March 30, which compare to as early as March 6 in years with a warm winter.

Early spring growing conditions

The spring started with some freezing temperatures on April 20-22, which caused low levels of freeze damage to early planted wheat fields in south central and southwest Kansas. The entire region between Sedgwick-Sumner counties and Meade County seemed to have lost a few spikelets due to these freezing temperatures, although this caused hardly more than 1-2% loss in individual fields. The departure from normal precipitation during September 1, 2020, until May 1, 2021, ranged from negative 5.6 to positive 0.6 inches in the wheat growing region in Kansas; thus, different levels of drought stress had started to develop around the state by May 1. Parts of central and south central Kansas had more advanced crops showing symptoms such as rolled up leaves, blue discoloration to the canopy, and lower canopy starting to turn yellow. The far southwest corner of the state, where drought stress started as early as the fall, had many fields nearing complete loss due to soil water deficit.

Grain filling period

The months of May and June had precipitation totals well above normal, with parts of the state receiving anywhere from 2.2 to 15.3 inches of precipitation between May 1 and June 21, 2021. These above-normal precipitation amounts were accompanied by below-normal temperatures during the month of May, with departure from normal ranging from negative 5 to positive 0.5°F. These were near ideal conditions for grain yield development, which not only benefited the early emerged crops, but more importantly ensured good growing conditions and potential for recovery for the late emerged crops. Likewise, these conditions favored the development of stripe rust and Fusarium head blight across the state (see the disease section below). Some excessive precipitation caused fields in the central Kansas region (Saline County area) to become water logged and lose test weight and productivity starting in the first week of June.

The first three weeks of June had temperatures well above normal (positive 1.5 to 6.6°F departure from normal), which accelerated the end of the season for much of the wheat crop that was relatively behind in development due to a combination of late emergence and a long winter. At the time of wheat harvest for the majority of the state (June 20 to July 10), consecutive rainfall events delayed wheat harvest, and in many cases, decreased the test weight of the crop. (Romulo Lollato. Kansas State University Extension Wheat Specialist and Mary Knapp, Kansas State University Climatologist)

Diseases

Diseases were a major factor in wheat production in 2021. The frequent rainfall and cooler-than-average temperatures in the spring favored the production of stripe rust, particularly in the southeast and central areas of the state. Fusarium head blight (head scab) was also problematic in the central and eastern regions of the state. Head scab reduced test weights and grain quality in many wheat fields, though producers are doing a good job including seed treatments at planting and spraying fungicides before flowering to mitigate the effects of diseases.

Insects

The 2020-2021 wheat production season seemed to have relatively fewer arthropod pests throughout the state than usual. However, the past few years have not produced a really large scale pest event, probably for several reasons. The pest management practices that help the most are as follows: 1. Timely eradication of volunteer wheat. This is really important as the volunteer wheat that exists from harvest until the fall crop germinates is necessary by most wheat pests for their existence during that timeframe. Managing the volunteer wheat problem is not easy but does impact the wheat crop.
2. Second-planting as late into the fall as is agronomicallyfeasible in your area. The less time wheat pests have to find and infest your planted crop, the less pests there usually are to damage that crop. 3. Utilizing varieties resistant to pest attack and/or those that have performed best in your area. Thus, Kansas wheat producers do seem to be getting better at mitigating damage due to wheat pests.

The pests that did cause some concern in 2020-2021 were not new or different. Armyworms were worrisome in the fall of 2020 as were army cutworms. Armyworm infestations stopped in the fall with the advent of freezing temperatures, and army cutworm infestations did not develop on the large scale basis as they did in the 2019-2020 growing season. There were a few scattered reports of fields replanted due to Hessian fly infestations, but this seems to happen somewhere around the state in localized areas every year.

Wheat Streak Mosaic was reported, and verified from counties as far into north central Kansas as Saline and Dickinson. This is not unusual, but seems to be getting a little more common so far east. Viruses that cause Wheat Streak Mosaic are vectored by wheat curl mites. These seem to be mainly transported to new hosts by wind, however, they do seem to be on a slow but steady
progression eastward in Kansas. (Jeff Whitworth, Kansas State University Department of Entomology)

Harvest Statistics

The Kansas Agricultural Statistics' July estimate of the 2021 crop was 380 million bushels from 6.9 million acres, up 35% from last year's crop. Yield per harvested acre is expected to average 55 bushels, up 10 bushels from last year's final yield. (July 2021, Crops Report, Kansas Agricultural Statistics)

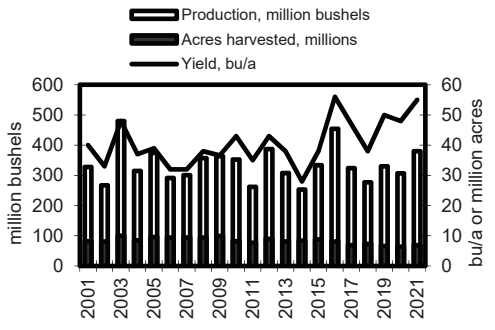

Figure 1. Historical Kansas wheat production

SY Monument remained the top-seeded variety in Kansas for the third consecutive year, accounting for 9.4% of the state's planted acres. WB Grainfield remained in second place at 5.5%. Zenda moved up a spot into third with 4.7%. The fourth most popular variety in Kansas was T158 at 3.1%. Joe moved up to fifth place at 2.8% and was the only hard white variety in the top ten. (March 2021, Wheat Variety, Kansas Agricultural Statistics)

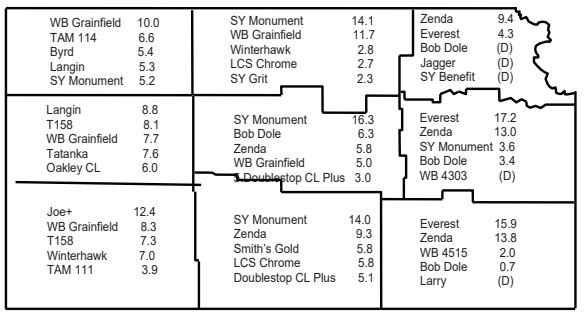

Figure 2. Leading wheat varieties in Kansas; percentage of seeded acreage for 2021 crop

2021 PERFORMANCE TESTS

The Kansas Agricultural Experiment Station annually compares both new and currently grown varieties in the state's major crop-producing areas. These performance tests generate unbiased performance information designed to help Kansas growers select wheat varieties suited for their area and conditions.

Site descriptions and management practices for each site are summarized in Table 3. One-year or one-location results can be misleading because of the possibility of unusual weather or pest conditions. **Be sure to keep extenuating environmental conditions in mind when examining test results.** For more information please visit: agronomy.ksu.edu/services/crop-performancetests/index.html.

Varieties

Public varieties are selected for inclusion in the tests on the basis of several criteria. Most represent new or established varieties from Oklahoma, Texas, and Colorado with potential for successful use in Kansas. Some are included as long-term checks. Others are entered at the request of the originating institution.

Originators or marketers enter privately developed varieties voluntarily. Entrants choose both the entries and test sites. The 2021 entrants are listed in Table 1.

Results and Variety Characterization

Results from Kansas tests are presented in Tables 4 through 12. Yields are reported as bushels per acre (60 lb/bu) and are adjusted to a moisture content of 13% where moistures were reported at harvest. Yields also are converted to percentages of the test average to speed recognition of the highest-yielding entries. Multi-year averages are presented for those varieties entered more than 1 year.

Additional information such as test weight, heading date, and plant height is helpful for fine-tuning variety comparisons. Planting varieties with a range of maturities helps minimize weather risks.

At the bottom of each table is the (0.05) least significant difference (LSD) for each column of replicated data. One can think of the LSD as a "margin of error" that shows how big the difference between two varieties must be for one to be 95% confident that the difference is real. The use of the LSD is intended to reduce the chance of overemphasizing small differences. Small variations in soil structure, fertility, water holding characteristics, and other test-site characteristics can cause considerable yield variation among plots of one variety.

Research and Duplication Policy

When companies submit entries, permission is given to Kansas State University to test varieties and/or hybrids designated on the entry forms in the manner indicated in the test announcements. Seed submitted for testing should be a true sample of the seed being offered for sale. All results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety, provided the source is referenced and data are not manipulated or reinterpreted; and 2) advertising statements by a individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1165 '2021 Kansas Performance Tests with Winter Wheat Varieties,' or the Kansas Crop Performance Test website, agronomy.ksu.edu/services/crop-performance-tests for details. Endorsement or recommendation by Kansas State University is not implied."

[3] Ratings from K-State Wheat Quality Laboratory and USDA-ARS Hard Winter Wheat Quality Laboratory. EX=excellent baking quality; AC=acceptable baking quality; LD= least desirable baking quality.

Table 3. Wheat performance test site descriptions and management in 2021

Region location	Soil type previous crop	Fungicide	Tillage	Plant-harvest	Conditions
Southeast Dryland					
East Central KS Experiment Field Ottawa (OT)	Woodson silt loam Soybean	No	Strip	10/22/20-7/14/21	Wet conditions throughout most of the growing season. Soils became waterlogged when 24 inches of rain fell between April and harvest. Fusarium head blight (scab) and stripe rust were prevalent and reduced test weights and grain quality.
Southeast Agricultural Research Center Parsons (PA)	Parsons silt loam Corn	No	Conv.	9/29/20-6/23/21	
Soft Wheat					
Southeast Agricultural Research Center Parsons (PA)	Parsons silt loam Corn	No	Conv.	9/29/20-6/23/21	
North Central Dryland					
North Central KS Experiment Field Belleville (BE)	Crete silt loam Soybean	Yes	Conv.	10/5/20-7/1/21	Timely precipitation and the cooler-than-normal temperatures during grain fill benefitted the wheat crop. Some varieties showed minimal tiller dieback from arctic temperatures during the winter months.
North Central KS Farmer's Field Beloit (BL)	Harney silt loam Soybean	Yes	No	10/21/20-7/7/21	
Central Dryland					
Central KS Farmer's Field Ellsworth (EL)	Silty clay loam Wheat	Yes	Min.	10/5/20-7/3/21	Evidence of some freeze damage in mid April. Head scab and stripe rust was prevalent in the region. Resistant varieties recovered nicely with support from fungicide application. Harvest was slightly delayed by rains, which further affected test weights.
Central KS Farmer's Field Hillsboro (HL)	McCook silt loam Soybean	Yes	No	10/16/20-6/22/21	
Central KS Farmer's Field Assaria (AS)	Silty clay loam Wheat	Yes	Conv.	10/16/20-6/23/21	
South Central Dryland					
South Central KS Farmer's Field Newton (NW)	Silty clay loam Soybean	Yes	No	10/20-6/25/21	Good emergence and stands in the fall set up tests for decent performance despite pressure from disease and adverse winter and spring weather. Test weights were also affected by scab and harvest delays.
South Central KS Experiment Field Hutchinson (HU)	Funmar-Taver loam Soybean	Yes	Conv.	10/20/20-6/24/21	
South Central KS Farmer's Field St. John (SJ)	Sandy clay loam Wheat	Yes	Conv.	10/31/20-7/7/21	
South Central Non-treated					
South Central KS Farmer's Field Wellington (WL)	Silty clay loam Wheat	No	Conv.	10/21/20-6/16/21	Test was not treated with a fungicide for variety evaluation under stressed conditions.
Northwest Dryland					
Central KS Farmer's Field Russell (RS)	Silty clay loam Fallow	Yes	Con.	10/6/20-7/2/21	Beneficial growing conditons trhoughout most of the growing season led to near-ideal conditions for grain fill and high yields. A hail and wind storm caused lodging, sometimes extensive, at Tribune and Colby.
Northwest Research-Extension Center Colby (CO)	Keith silt loam Fallow	Yes	Min.	10/1/20-7/14/21	
Northwest Research-Extension Center Tribune (TR)	Richfield silt loam Grain Sorghum	Yes	Conv.	9/30/20-7/9/21	
Northwest KS Farmer's Field Decatur (DC)	Harney clay loam Fallow	Yes	No	10/19/20-7/17/21	
Southwest Dryland					
Southwest KS Farmer's Field Larned (LA)	Harney clay loam Grain sorghum	Yes	Conv.	10/5/20-6/25/21	The region missed some of the rains in the fall that benefitted the northwest region, but overall the growing season was conducive to higher yields and better grain quality.
Southwest KS Farmer's Field Hugoton (HG)	Sandy clay loam Grain Sorghum	Yes	Min.	9/26/20-7/9/21	
Southwest Research-Extension Center Garden City (GC)	Clay loam Fallow	Yes	Min.	9/30/20-7/7/21	
Western Irrigated					
Northwest Research-Extension Center Colby (CO)	Keith silt loam Fallow	Yes	Min.	10/1/20-7/14/21	Very good year as most varieties yielded greater than 100 bushels per acre. Scab was prevalent at Colby and Garden City, affecting test weights and grain quality.
Southwest Research-Extension Center Garden City (GC)	Keith silt loam Fallow	Yes	Min.	9/30/20-7/9/21	
Western KS Farmer's Field Hugoton (HG)	Sandy clay loam Potatoes	Yes	Conv.	9/29/20-7/16/21

Chris Boyd, Medicine Lodge (South Central District)

About this directory

The seed producers listed in this directory have applied to the Kansas Crop Improvement Association (KCIA) for inspection of seed production fields. KCIA checks all seed sources to confirm seed eligibility.

Seed produced on these fields is not Certified or Quality Assured until the field has passed inspection and the harvested seed has been properly conditioned, sampled and tested.

Seed meeting certification standards is issued a Certificate of Inspection and may be sold as Certified Seed. Quality Assured seed must meet similar standards.

Kansas Seed Law requires all seed to be properly labeled. The label is your warranty. Each bag of Kansas Certified Seed must be labeled with an official KCIA certification tag.

A completed KCIA Bulk Retail Sale Certificate or Bulk Invoice Label must accompany each bulk sale. Contact KCIA regarding the specific rules for re-selling bulk Certified Seed.

KCIA does not produce, process, buy or sell seed; therefore, assumes no financial responsibility regarding any seed listed herein.

Growers guarantee that Foundation, Registered, Certified or Quality Assured seed sold by them conforms to the standards of the Association in origin, varietal purity and quality. KCIA should be advised of any complaints made to the producer or vendor of seed.

Listing of a producer does not imply that all requirements have been met at time of publishing. Contact KCIA if you have concerns or questions about seed offered as Certified or KCIA Quality Assured.

Plant Variety Protection

The Plant Variety Protection Act (PVPA) makes it possible to protect plant varieties by law. Therefore, it is unlawful to sell, offer for sale or expose for sale, uncertified seed by variety name when it is a variety for which a Certificate of Plant Protection has been issued, specifying sale only as a class of certified seed.

It is the responsibility of the grower to inform the purchaser that a variety is protected and at what level. This may be accomplished on the label by the appropriate statements. The status of varieties listed in this directory is as follows:

AMERICA'S TRUSTED
WHEAT GENETICS

NEW VARIETIES
EXCLUSIVELY
FROM AGSECO

AG RADICAL
NEW FOR 2021
» Excellent yield potential
» Excellent test weight
» Medium to high protein content
» Excellent leaf rust resistance
» Excellent straw strength

AG GOLDEN
NEW FOR 2021
» Very high test weight
» Excellent winter hardiness
» Excellent yield potential
» Excellent stem rust resistance
» Long coleoptile length

AG ICON
» Exceptional yield potential
» Excellent straw strength
» Early in maturity
» Good baking and milling quality

TAM 114
» Superior leaf disease resistance
» Most drought tolerant
» Very good winterhardiness
» Excellent yield potential for milling, baking and grazing

TAM 205
» Large seed with high test weight
» Drought tolerant
» Resistant to leaf rust, stripe rust and stem rust
» Resistant to fusarium head blight or scab

Shouldn't your wheat
weather the weather?

Choose biotrinsic™, a collection of seed treatments powered by nature's microbes – proven to help protect crops and increase yield.

biotrinsic™ has been shown to increase wheat yields by **3.7 bushels per acre** under heat stress

Ask your trusted retailer or visit
Indigoag.com/biotrinsic to learn more.

biotrinsic™ by indigo

For details on the 2021 Winter Wheat Grower Satisfaction Guarantee, visit Indigoag.com/biotrinsic. Except for the Grower Satisfaction Guarantee as expressly described, Indigo does not make any guarantees with respect to any outcomes of any Indigo product or service. Guarantee is limited to substitution of an alternative Indigo product and does not include any refund rights. A wide range of variables affect product performance, your results may vary. Additional terms, conditions and limitations may apply. Product may not be available in all areas.

POLANSKY PURE

HIGHER YIELDS START WITH HIGHER QUALITY SEED

Paradise WHEAT

- High Yield Record - 80 to 100 bushels
- Good Fall Forage Potential
- Good Stripe Rust Resistance
- Outstanding Mill and Bake Quality
- Good Aluminum Tolerance

ROCK★STAR WHEAT

- Excellent Leaf and Stripe Rust Tolerance
- Good Fall Forage Potential
- Good Straw Strength
- Excellent Soil Borne Mosaic Tolerance
- Good Grazing in Southern/Eastern KS

SINCE 1941 POLANSKY SEED BELLEVILLE, KS

The combination of the air screen cleaner, length grader, gravity table, color sorter and magnets removes impurities, including white caps,that can plug air seeders and reduce yield.

DAN HERALD FARMS

Certified Seed Sales

Large Heavy Seed

Breakthrough
New OSU release with Mosaic resistance in a high performance variety.

TAM 115
Texas A&M breed variety for the panhandles with greatly improved straw strength. Performs well under irrigation while retaining the toughness of its parent, TAM 112.

TAM 204
Beardless dual-purpose wheat with strong disease package.

TAM 112
Excellent dryland producer, proven to perform with outstanding drought tolerance.

IBA
Last year's Texas County Dryland Trial winner with extreme yield potential under irrigation.

From farmer to consumer, OGI varieties are proven performers every year. Our wheat varieties provide the quality characteristics end-users and consumers desire, and they provide the agronomics wheat producers require. We strive to create diverse, high-quality and resilient wheat varieties that the entire wheat food chain can trust and rely upon.

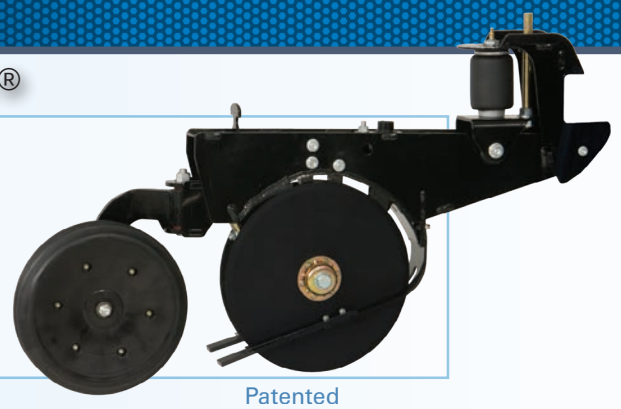
LANDOLL®

Industry's finest
Fluted Seed Meter

Industry's first
Pneumatic Down Pressure



Patented

It's a Winning Precision Combination

The exclusive Fluted Seed Metering System combined with the industry's first Pneumatic Down Pressure make it the most precise folding grain drill on the market today. Combine that with the new 50' working width and you have the ability to accurately seed 30 acres per hour.

The new 50' model also features the Loup Monitor as standard equipment for precise in-cab monitoring of population, seed sensors, and bin levels. Available in 10' rigid through 50' folding, the Landoll 5000 Series Grain Drills are the new industry benchmark for precision seeding productivity.
